

**Essential idea:** The greater the probability that molecules will collide with sufficient energy and proper orientation, the higher the rate of reaction.

### 6.1 Collision theory and rates of reaction

#### Nature of science:

The principle of Occam's razor is used as a guide to developing a theory—although we cannot directly see reactions taking place at the molecular level, we can theorize based on the current atomic models. Collision theory is a good example of this principle. (2.7)

#### Understandings:

- Species react as a result of collisions of sufficient energy and proper orientation.
- The rate of reaction is expressed as the change in concentration of a particular reactant/product per unit time.
- Concentration changes in a reaction can be followed indirectly by monitoring changes in mass, volume and colour.
- Activation energy ( $E_a$ ) is the minimum energy that colliding molecules need in order to have successful collisions leading to a reaction.
- By decreasing  $E_a$ , a catalyst increases the rate of a chemical reaction, without itself being permanently chemically changed.

#### Applications and skills:

- Description of the kinetic theory in terms of the movement of particles whose average kinetic energy is proportional to temperature in Kelvin.
- Analysis of graphical and numerical data from rate experiments.

#### International-mindedness:

- Depletion of stratospheric ozone has been caused largely by the catalytic action of CFCs and is a particular concern in the polar regions. These chemicals are released from a variety of regions and sources, so international action and cooperation have been needed to ameliorate the ozone depletion problem.

#### Theory of knowledge:

- The Kelvin scale of temperature gives a natural measure of the kinetic energy of gas whereas the artificial Celsius scale is based on the properties of water. Are physical properties such as temperature invented or discovered?

#### Utilization:

Syllabus and cross-curricular links:

Topic 5.3—what might be meant by thermodynamically stable vs kinetically stable?

Topic 13.1—fireworks and ions

Option A.3—everyday uses of catalysts

Option B.2—enzymes

Biology topic 8.1—metabolism

**6.1 Collision theory and rates of reaction**

- Explanation of the effects of temperature, pressure/concentration and particle size on rate of reaction.
- Construction of Maxwell–Boltzmann energy distribution curves to account for the probability of successful collisions and factors affecting these, including the effect of a catalyst.
- Investigation of rates of reaction experimentally and evaluation of the results.
- Sketching and explanation of energy profiles with and without catalysts.

**Guidance:**

- Calculation of reaction rates from tangents of graphs of concentration, volume or mass vs time should be covered.
- Students should be familiar with the interpretation of graphs of changes in concentration, volume or mass against time.

**Aims:**

- **Aims 1 and 8:** What are some of the controversies over rate of climate change? Why do these exist?
- **Aim 6:** Investigate the rate of a reaction with and without a catalyst.
- **Aim 6:** Experiments could include investigating rates by changing concentration of a reactant or temperature.
- **Aim 7:** Use simulations to show how molecular collisions are affected by change of macroscopic properties such as temperature, pressure and concentration.
- **Aim 8:** The role that catalysts play in the field of green chemistry.
